Drugs Approved by the FDA

Drug Name: Caduet (amlodipine/atorvastatin)

The following information is obtained from various newswires, published medical journal articles, and medical conference presentations.

Description of Medical Areas

Company: Pfizer
Approval Status: Approved January 2004
Treatment for: Hypertension/Angina

General Information

Caduet combines the drugs amlodipine (Norvasc, Lotrel) and atorvastatin (Lipitor), two widely prescribed cardiovascular medications. It's the first medicine to treat two different conditions, high blood pressure and high cholesterol.

It is indicated for the treatment of hypertension, chronic stable angina and vasospastic angina (Prinzmetal's or variant angina). It is also indicated for primary hypercholesterolemia, elevated serum TG levels.

New Insights for Multifactorial Disease Therapy: The Challenge of the Symbiotic Drugs

Eliezer J. Barreiro and Carlos Alberto Manssour Fraga

Laboratório de Avaliação e Síntese de Substâncias Bioativas (LASSBio), Faculdade de Farmácia, Universidade Federal do Rio de Janeiro, P.O. Box 68023, 21944-971, Rio de Janeiro, RJ, Brazil.

Abstract: Some physiopathological processes involved in the genesis of diseases could suggest the necessity of designing bioligands or prototypes that aggregate, in only one molecule, dual pharmacodynamical properties, becoming able to be recognized by two elected bioreceptors. This approach can have distinct aspects and, when a novel ligand or a prototype acts in two elected targets belonging to the same biochemical pathway, *e.g.* arachidonic acid cascade, it receives the denomination of dual or mix agent. On the other hand, if these two targets belong to distinct biochemical routes and both are related to the same disease, we can characterize the agents able to modulate it as symbiotic ligands or prototypes. In the present work, we provide some examples and applications of the molecular hybridization concept for the structural design of new symbiotic ligands and prototypes, especially those applied in the treatment of chronic-degenerative disorders.

Key Words: Symbiotic drugs; molecular hybridization; multifactorial diseases; therapeutic innovation; drug design; dual compounds.

Abstract: Thalidomide ([2-(2,6-dioxo-hexahydro-3-(R,S)-pyridinyl)-1,3-isoindolinedione]), well known by its teratogenic effect, caused birth defects in up to 12,000 children in the 1960s. More recently, this drug was approved by the US Food and Drug Administration for the treatment of erythema nodosum leprosum, under restricted-use program, and a variety of new possible therapeutic applications have been described. This article will accomplish a review of medicinal chemistry aspects of thalidomide and state of the art in the development of new anti-inflammatory and immunomodulator drug candidates designed using thalidomide as lead-compound.

^bDepartamento de Química, ICE, Universidade Federal Rural do Rio de Janeiro (UFRRJ), Seropédica, RJ 23851-970, Brazil

Received 8 May 2006; revised 15 June 2006; accepted 19 June 2006

Abstract—In the present study, we describe a new 3D-QSAR analysis of 42 previously reported thalidomide analogues, with the ability to modulate the pro-inflammatory cytokine TNF α , by using comparative molecular field analysis (CoMFA) and comparative molecular similarity indices analysis (CoMSIA). Three statistically significant models were obtained. The best resulting CoMFA and CoMSIA models have conventional r^2 values of 0.996 and 0.983, respectively. The cross-validated q^2 values are 0.869 and 0.868, respectively. The analysis of CoMFA and CoMSIA contour maps provided insight into the possible sites for structural modification of the thalidomide analogues for better activity and reduced toxicity.

PDE4 subtypes and splice variants

The phosphodiesterase 4 (PDE4) is the most important PDE family in the control of intra-cellular cAMP. PDE4 is encoded by four separate genes (PDE4A, 4B, 4C, and 4D). The PDE4 subtypes are differentially distributed in brain regions, indicating that they may exert different CNS activity. Our preliminary studies supported the idea that PDE4D plays a critical role in the mediation of memory. Using gene knockout and gene silencing techniques, we are determining the roles of PDE4D and its splice variants in memory processes and in other aspects of behavior. Hopefully, this will help guide the chemical syntheses of potent, selective inhibitors of individual PDE4 subtypes.

Received 8 November 2005; revised 10 May 2006; accepted 10 May 2006

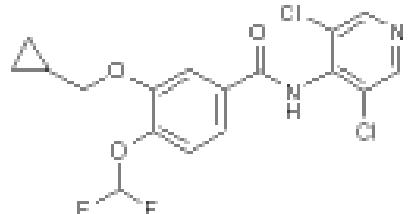

Abstract—In the present work, several computational methodologies were combined to develop a model for the prediction of PDE4B inhibitors' activity. The adequacy of applying the ligand docking approach, keeping the enzyme rigid, to the study of a series of PDE4 inhibitors was confirmed by a previous molecular dynamics analysis of the complete enzyme. An exhaustive docking procedure was performed to identify the most probable binding modes of the ligands to the enzyme, including the active site metal ions and the surrounding structural water molecules. The enzyme–inhibitor interaction enthalpies, refined by using the semiempirical molecular orbital approach, were combined with calculated solvation free energies and entropy considerations in an empirical free energy model that enabled the calculation of binding free energies that correlated very well with experimentally derived binding free energies. Our results indicate that both the inclusion of the structural water molecules close to the ions in the binding site and the use of a free energy model with a quadratic dependency on the ligand free energy of solvation are important aspects to be considered for molecular docking investigations involving the PDE4 enzyme family.

Phosphodiesterase-4 inhibitors have a broad spectrum of anti-inflammatory effects in asthma. Phosphodiesterase-4 (PDE4) inhibitors inhibit the recruitment and activation of key inflammatory cells, including mast cells, eosinophils, T lymphocytes, macrophages and neutrophils, as well as the hyperplasia and hypertrophy of structural cells, including airway smooth-muscle cells, epithelial cells and sensory and cholinergic nerves.

Abstract—In this work, we present the results of two combined approaches, molecular docking and comparative molecular field analysis (CoMFA), to propose how the selective cyclooxygenase-2 inhibitor celecoxib could act as a p38 mitogen-activated protein (MAP) kinase inhibitor. The docking analysis revealed why celecoxib has a less favorable binding energy ($\Delta G = -12.4$ kcal/mol) than the selective p38 MAP kinase (p38 MAPK) inhibitor, SB203580 ($\Delta G = -22.2$ kcal/mol). The CoMFA results revealed unfavorable steric effects that can be related to the predicted lower p38 MAP kinase inhibitory activity of celecoxib. Additionally, FlexX and CoMFA results also suggested that etoricoxib, another selective COX-2 inhibitor, could inhibit p38 MAP kinase.

Science Direct- Top-25 Hottest Articles Bioorganic Medicinal Chemistry Letters: 13º artigo mais consultado no período de julho-setembro de 2005:

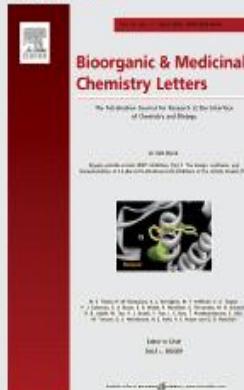

http://top25.sciencedirect.com/index.php?cat_id=5&subject_area_id=3&journal_id=0960894X.

INTRODUCTION

The ScienceDirect TOP25 Hottest Articles is a free quarterly service from ScienceDirect. When you subscribe to the ScienceDirect TOP25, you'll receive an e-mail every three months listing the ScienceDirect users' 25 most frequently downloaded journal articles, from any selected journal among more than 2,000 titles in the ScienceDirect database, or from any of 24 subject areas.

SIGN UP!

Would you like to be kept posted on the latest **TOP25 ARTICLES** within **Bioorganic & Medicinal Chemistry Letters?**

Check out the ScienceDirect TOP25 Hottest Articles within your area of interest.

Subject Area:	<input type="button" value="Biochemistry, Genetics and Molecular Biology"/>
Journal:	<input type="button" value="Bioorganic & Medicinal Chemistry Letters"/>

With these drop-down menus, the ScienceDirect TOP25 Hottest Articles are selected. Please refine your selection if necessary. To see the overall TOP25 within a certain subject area or journal, please select 'all subjects' or 'all journals' from the drop-down menus.

TOP25 articles within the journal: Bioorganic & Medicinal Chemistry Letters

1. [Convenient synthesis of human calcitonin and its methionine sulfoxide derivative](#) • Short communication
Bioorganic & Medicinal Chemistry Letters, Volume 12, Issue 16, 1 August 2002, Pages 2237-2240
Shi, T.; Rabenstein, D.L.
2. [Structural biology of G protein-coupled receptors](#) • Short communication
Bioorganic & Medicinal Chemistry Letters, Volume 15, Issue 16, 1 August 2005, Pages 3654-3657
Lundstrom, K.
13. [The molecular basis for coxib inhibition of p38@a MAP kinase](#) • Short communication
Bioorganic & Medicinal Chemistry Letters, Volume 15, Issue 15, 1 August 2005, Pages 3506-3509
Sperandio da Silva, G.M.; Lima, L.M.; Fraga, C.A.M.; Sant'Anna, C.M.R.; Barreiro, E.J.

Modelo CoMFA – Mapa de contorno eletrostático & estérico

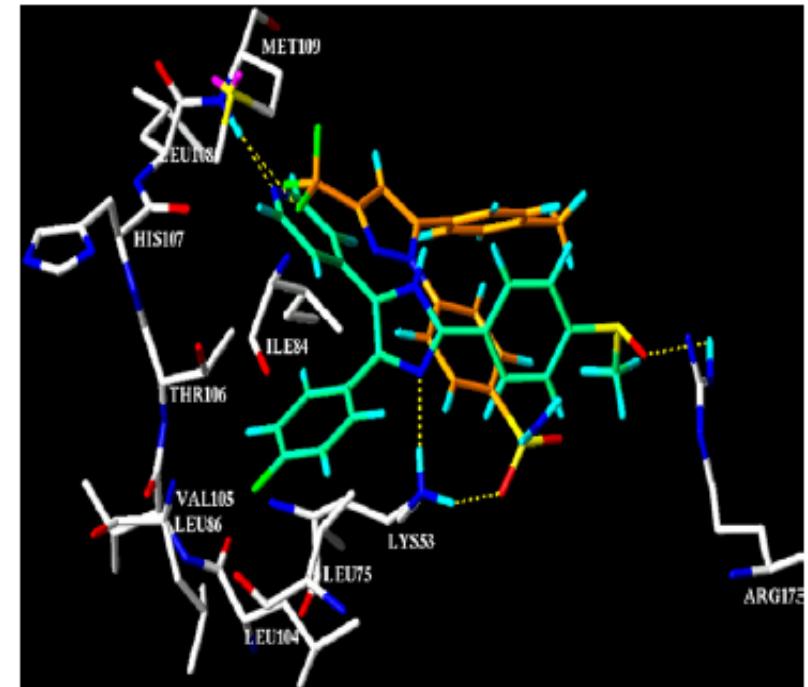

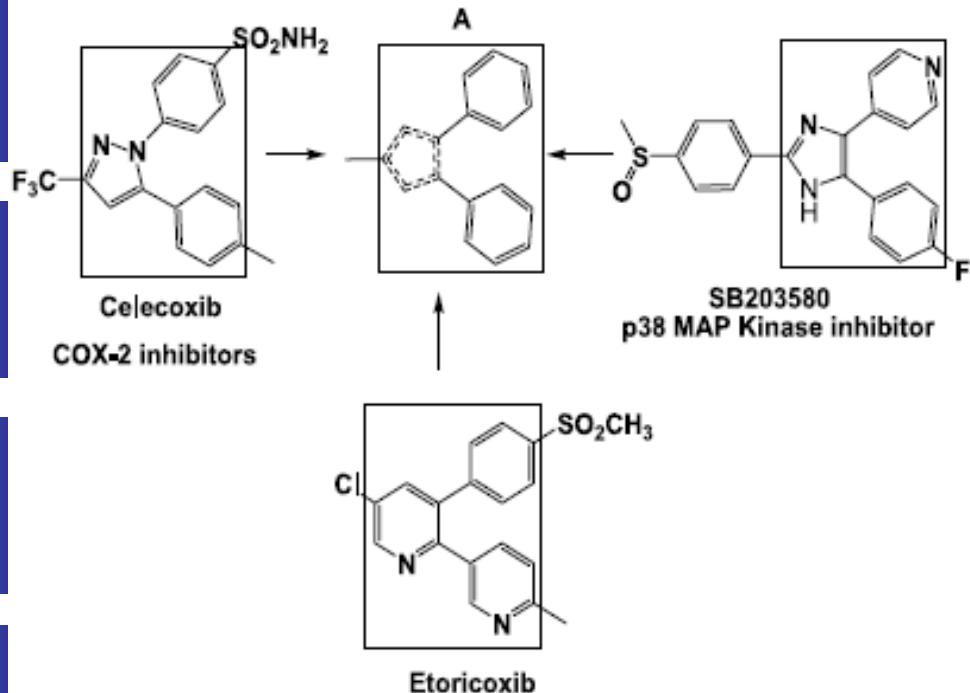

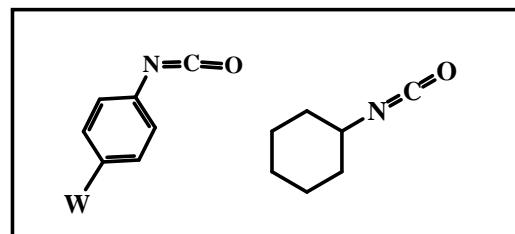

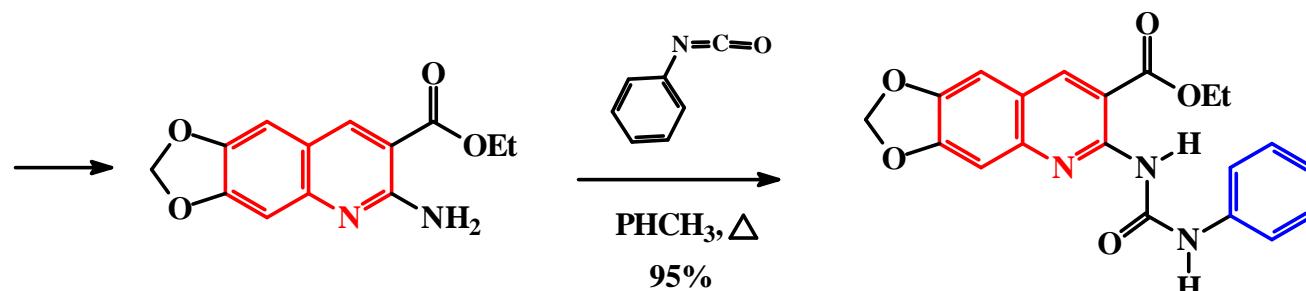

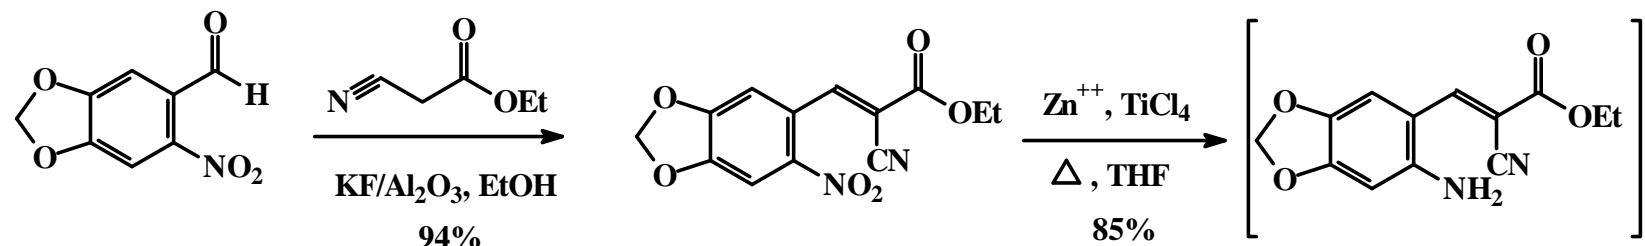

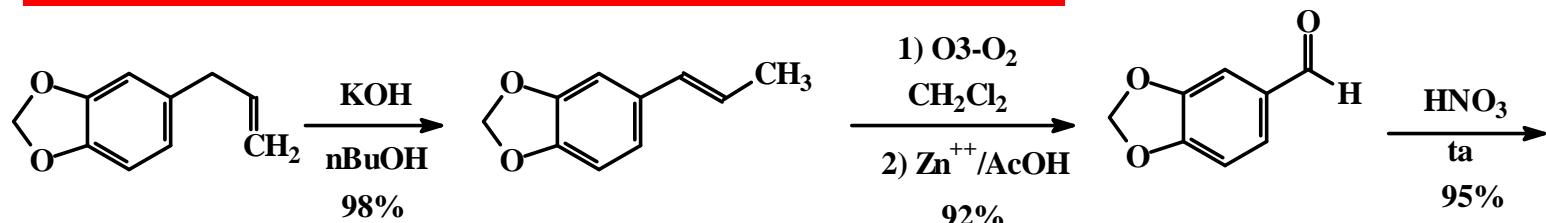

Figure 2. Probable binding conformation of celecoxib and its alignment in the binding site of p38 MAPK. FexX docking shows most important amino acid of p38 MAPK to interact with celecoxib. For celecoxib the carbon atoms are shown in orange (C), blue (N), red (O), and green (halogen). For SB203580, the carbon atoms are shown in green-blue (C), blue (N), red (O), and green (halogen).

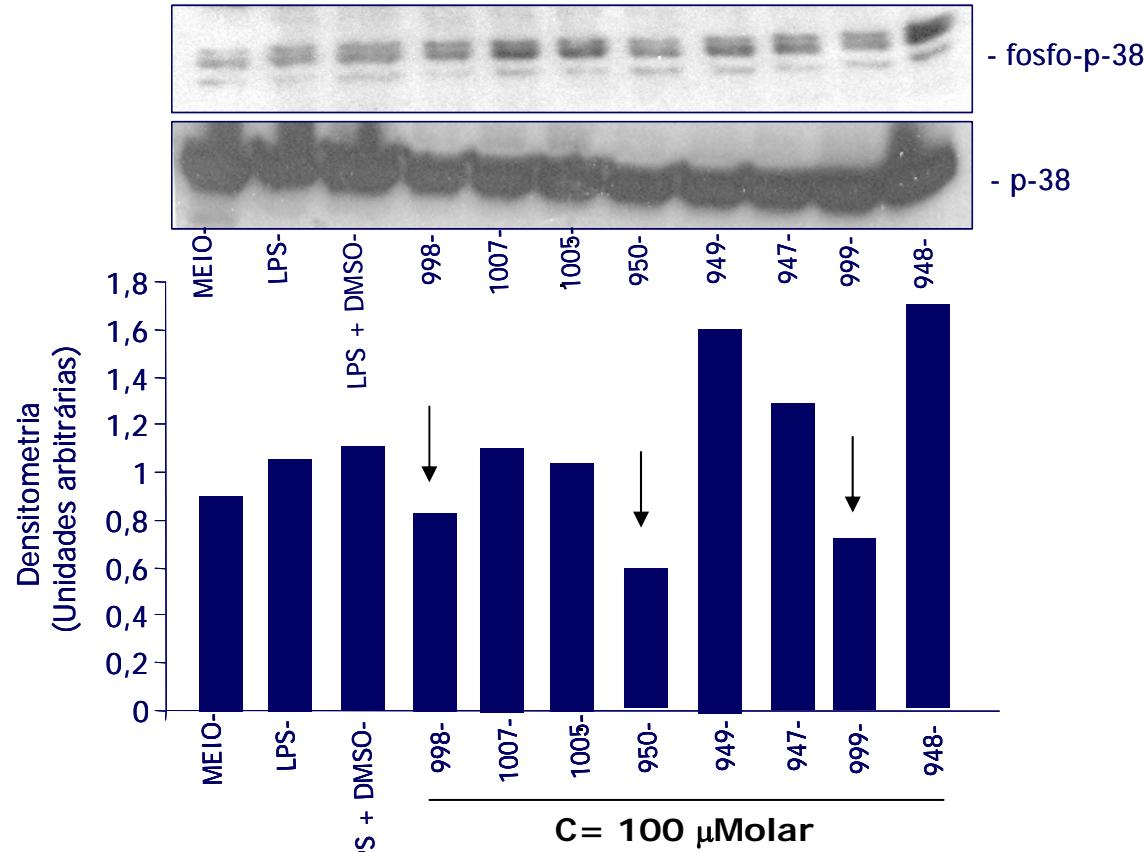

Síntese dos compostos-alvo

Perfil Farmacológico

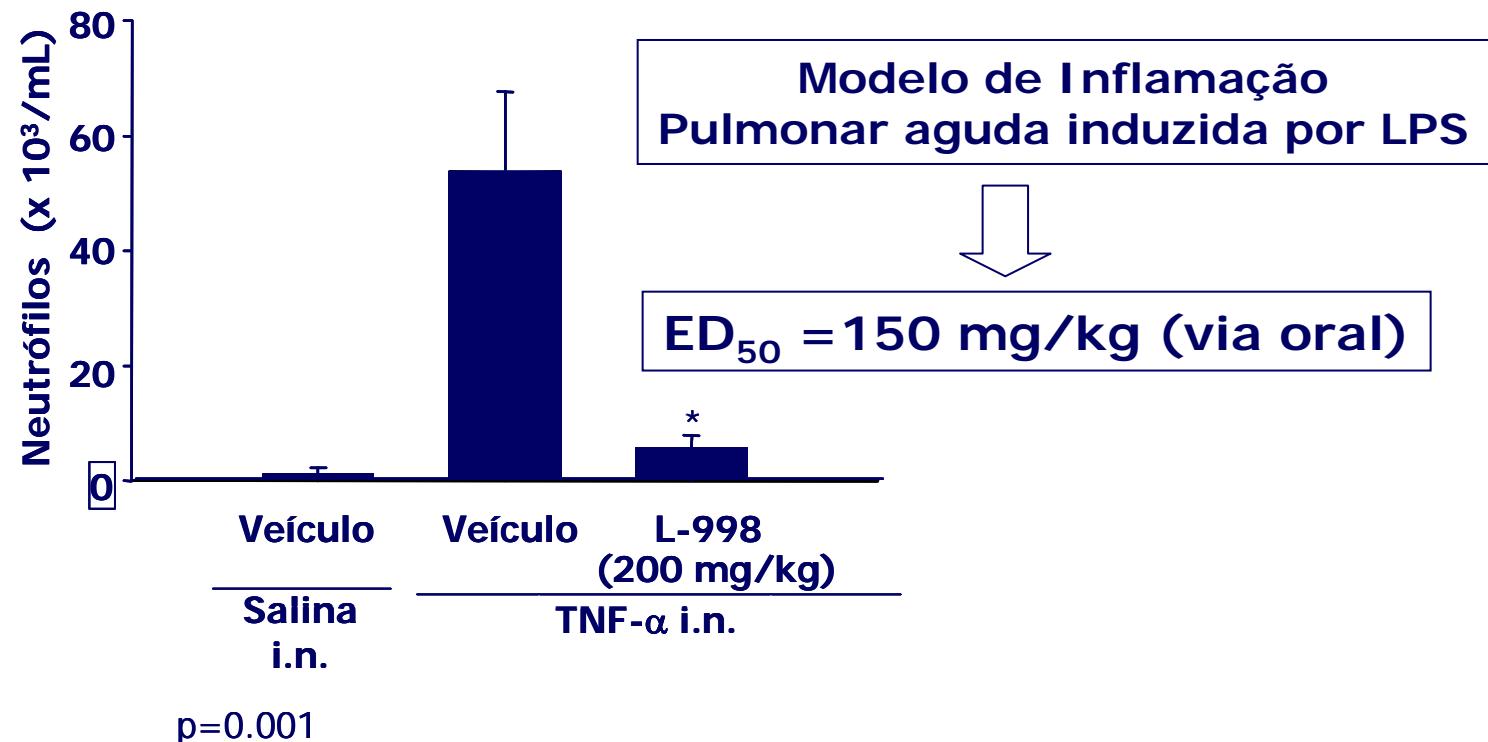

EFEITOS DOS COMPOSTOS INIBIDORES DE p38 SOBRE A FOSFORILAÇÃO DA MAP KINASE p38 EM PBMC INDUZIDA POR LPS

(Western-Blot)

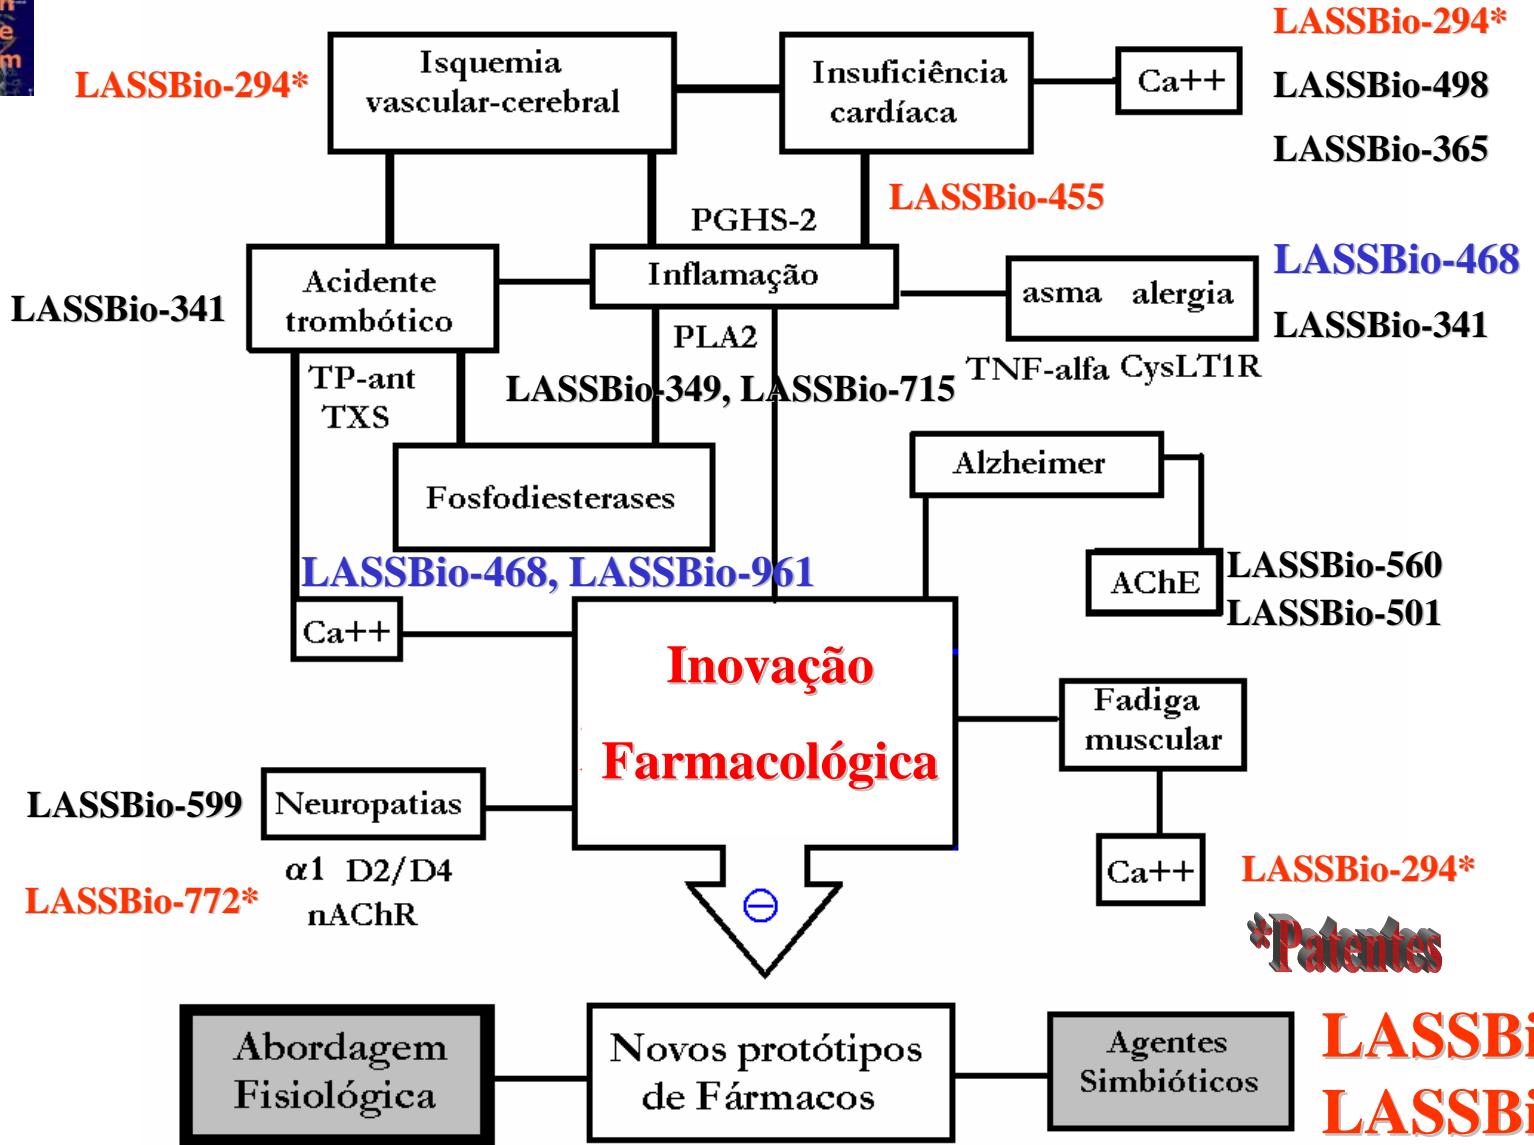

Perfil Farmacológico 2

EFEITO DE TRATAMENTO COM L-998 NO INFLUXO DE NEUTRÓFILOS APÓS INSTILAÇÃO INTRANASAL DE TNF- α

Os animais foram pré-tratados com LASSBio-998 p.o., 4h antes da inalação de LPS (0,5 mg/mL) e a contagem de neutrófilos foi efetuada após 3h.
